

ABSTRACT OF THE INVENTION

A public telephone and Internet access system that comprises Personal Digital Assistants (PDA) that are connected to an ethernet or other Local Area Network by a network cradle, and a number of ethernet telephones connected to

5 the same Local Area Network. The PDAs store encrypted information about their owners, including the owner's name, their phone forwarding preferences, access permissions to the network, and charging/billing information. When a PDA is attached to a network cradle, this information is automatically transferred to the gatekeeper, which is a server that performs management tasks for the

10 ethernet phone network. These tasks include deciding whether or not a user is allowed to sign up and use a public ethernet phone, maintaining billing and charging information, and forwarding incoming calls for a given user to the ethernet phone at the user's current location. This invention provides a secure method for the PDA and the gatekeeper to exchange authentication information.
